

Equations for Blood Circulation

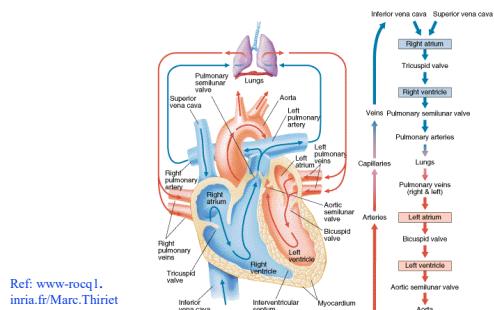

Agnès Drochon

UMR CNRS 5295, I2M, Toulouse

Contents:

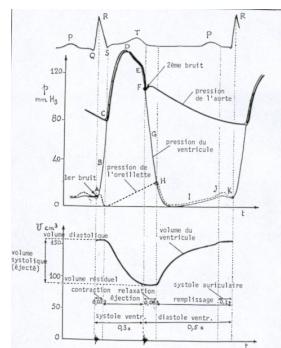

- Heart and circulation
- Navier-Stokes equations
- Local resolution of continuity and motion equations:
 - * Poiseuille flow (stationary flow in a rigid tube)
 - * Womersley flow (sinusoidal flow in a rigid tube)
 - * Pulsed flow in a deformable tube
- Bernoulli's equation
- Global modelisation of blood and vessel:
 - * 1D models: variable of the pb = time
 - * 1D models: variables of the pb = time + 1 space coordinate
- Starling's law
- Fick's diffusion law
- Darcy equation: porous medium
- Visco-elasticity: basic tools
- Introduction to solid and soft tissues mechanics

HEART and CIRCULATION

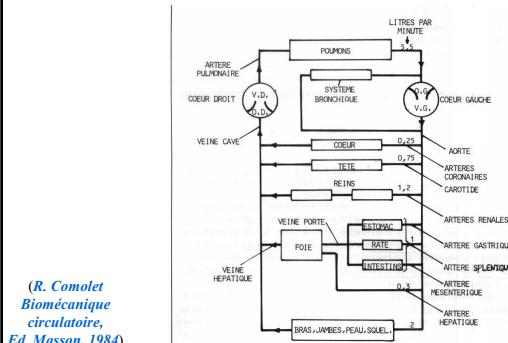

Heart physiological data

*(R. Comelot
Biomécanique circulatoire,
Ed. Masson, 1984)*

ABC: isovolumic contraction ;
CDE: ejection;
FGH: isovolumic relaxation;
HIJK: filling

Circulatory tree

Arterial and venous network: physiological data

	Diamètre D (cm)	Nombre de vaisseaux	Longueur (cm)	Section totale équivalente (cm²)	Vitesse U (cm/s)	Nombre de Reynolds
Aorte	2	1	59	3.14	24	1200
	0.5	40	29	8	9.3	116
	0.07	1800	5.8	11	7	12.2
	0.005	1 000 000	0.15	20	3.7	0.46
Micro-capillaires	0.0008	$3 \cdot 10^7$	0.15	1500	0.05	0.001
	0.0075	15 000 000	0.22	670	0.11	0.02
	0.03	76000	2.1	54	1.4	1.05
Veine Cave	2.5	1	59	4.8	15.5	968

(R. Comelot Biomécanique circulatoire, Ed. Masson, 1984)

$$\text{Reynolds: } \mathcal{R} = \frac{\rho \cdot U \cdot D}{\mu}$$

Blood viscosity

S. Chien's curve (1970)

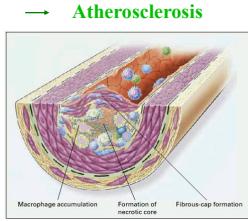

NP, NA: Normal RBCs in Plasma or in Albumin solution
HA: Hardened RBCs in Albumin solution

Fischer and Schmid-Schönbein, Blood Cells (3), 1977

Rheology of Fluids: definitions

- Newtonian fluid:
Its viscosity does not depend on shear rate
 - Shear thinning fluid:
Its viscosity decreases when shear rate increases
 - Yield stress fluid:
Begins to flow only if the stress is higher than a critical value
 - Thixotropic fluid:
Its viscosity decreases with time, under constant shear rate.
Restructuration is possible if flow is stopped.
- Viscosity decreases when temperature increases:
Ex.: water: at 20°C: $\mu = 1 \text{ mPa.s}$; at 60°C: $\mu = 0.6 \text{ mPa.s}$

CLINICAL MOTIVATIONS

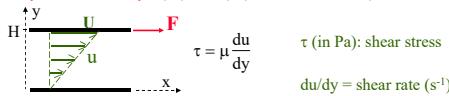

R. Ross, N Engl J Med, 1999

- Atherosclerosis
- Stents, prosthesis
- Extracorporeal circulation
- Medical device design
- Surgical planning
- Drug transport
- Hyperviscosity, hyperaggregability, ...
- Coupling with 3D imaging: patient's specific predictions
- Medical imaging

Fluid mechanics: basic definitions

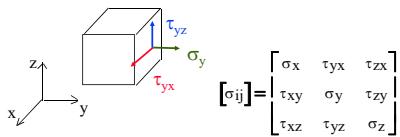

Density = ρ (in kg/m³)

Dynamic viscosity = μ (in Pa.s). (Resistance to flow)

τ (in Pa): shear stress
 du/dy = shear rate (s⁻¹)

Stresses on an elementary fluid volume:

$$[\sigma_{ij}] = \begin{bmatrix} \sigma_x & \tau_{yx} & \tau_{zx} \\ \tau_{xy} & \sigma_y & \tau_{zy} \\ \tau_{xz} & \tau_{yz} & \sigma_z \end{bmatrix}$$

Navier-Stokes equations

$$\frac{\partial(\rho u_i)}{\partial t} + \rho u_k \frac{\partial u_i}{\partial x_k} = \rho f_i + \frac{\partial \sigma_{ik}}{\partial x_k}$$

$$\downarrow$$

$$\text{Incompressible newtonian fluid: } \sigma_{ij} = -P \delta_{ij} + \mu \left(\frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} \right)$$

$$\left\{ \begin{array}{l} \rho \left(\frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} + w \frac{\partial u}{\partial z} \right) = \rho f_1 - \frac{\partial P}{\partial x} + \mu \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} \right) \\ \rho \left(\frac{\partial v}{\partial t} + u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} + w \frac{\partial v}{\partial z} \right) = \rho f_2 - \frac{\partial P}{\partial y} + \mu \left(\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} + \frac{\partial^2 v}{\partial z^2} \right) \\ \rho \left(\frac{\partial w}{\partial t} + u \frac{\partial w}{\partial x} + v \frac{\partial w}{\partial y} + w \frac{\partial w}{\partial z} \right) = \rho f_3 - \frac{\partial P}{\partial z} + \mu \left(\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} + \frac{\partial^2 w}{\partial z^2} \right) \end{array} \right.$$

$$+ \text{mass conservation: } \frac{\partial u_i}{\partial x_i} = 0$$

Equations in cylindrical coordinates

$$\rightarrow \text{Mass conservation: } \frac{\partial \rho}{\partial t} + \frac{1}{r} \frac{\partial(r \rho u_r)}{\partial r} + \frac{1}{r} \frac{\partial(\rho u_\theta)}{\partial \theta} + \frac{\partial(\rho u_z)}{\partial z} = 0$$

→ Navier-Stokes equations

$$\begin{aligned} \rho \left(\frac{\partial u_r}{\partial t} + u_r \frac{\partial u_r}{\partial r} + u_\theta \frac{\partial u_r}{\partial \theta} + u_z \frac{\partial u_r}{\partial z} \right) &= -\frac{\partial P}{\partial r} + \mu \left[\frac{1}{r} \frac{\partial}{\partial r} \left(r u_r \right) \right] + \frac{1}{r^2} \frac{\partial^2 u_r}{\partial \theta^2} + \frac{\partial^2 u_r}{\partial z^2} - \frac{2}{r^2} \frac{\partial u_\theta}{\partial \theta} \\ \rho \left(\frac{\partial u_\theta}{\partial t} + u_r \frac{\partial u_\theta}{\partial r} + u_\theta \frac{\partial u_\theta}{\partial \theta} + u_z \frac{\partial u_\theta}{\partial z} \right) &= -\frac{1}{r} \frac{\partial P}{\partial \theta} + \mu \left[\frac{1}{r} \frac{\partial}{\partial r} \left(r u_\theta \right) \right] + \frac{1}{r^2} \frac{\partial^2 u_\theta}{\partial \theta^2} + \frac{\partial^2 u_\theta}{\partial z^2} + \frac{2}{r^2} \frac{\partial u_r}{\partial \theta} \\ \rho \left(\frac{\partial u_z}{\partial t} + u_r \frac{\partial u_z}{\partial r} + u_\theta \frac{\partial u_z}{\partial \theta} + u_z \frac{\partial u_z}{\partial z} \right) &= -\frac{\partial P}{\partial z} + \mu \left[\frac{1}{r} \frac{\partial}{\partial r} \left(r u_z \right) \right] + \frac{1}{r^2} \frac{\partial^2 u_z}{\partial \theta^2} + \frac{\partial^2 u_z}{\partial r^2} \end{aligned}$$

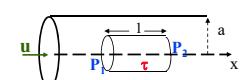

→ Shear stresses

$$\begin{aligned} \sigma_{rr} &= -P + 2\mu \frac{\partial u_r}{\partial r} & \tau_{r\theta} &= \tau_{\theta r} = \mu \left[r \frac{\partial}{\partial r} \left(\frac{u_\theta}{r} \right) + \frac{1}{r} \frac{\partial u_r}{\partial \theta} \right] \\ \sigma_{\theta\theta} &= -P + 2\mu \left(\frac{1}{r} \frac{\partial u_\theta}{\partial \theta} + \frac{u_r}{r} \right) & \tau_{\theta z} &= \tau_{z\theta} = \mu \left[\frac{\partial u_\theta}{\partial z} + \frac{1}{r} \frac{\partial u_z}{\partial \theta} \right] \\ \sigma_{zz} &= -P + 2\mu \frac{\partial u_z}{\partial z} & \tau_{rz} &= \tau_{zr} = \mu \left(\frac{\partial u_z}{\partial r} + \frac{\partial u_r}{\partial z} \right) \end{aligned}$$

Laminar steady flow in a rigid tube – Poiseuille law

$$\text{Forces Equilibrium: } \tau 2\pi r l = -\pi r^2 \frac{dP}{dx}$$

$$\text{Newtonian fluid: } \tau = -\mu \frac{du}{dr}$$

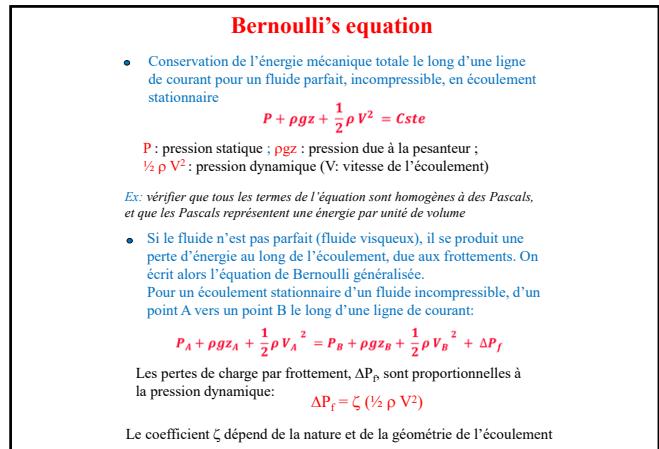

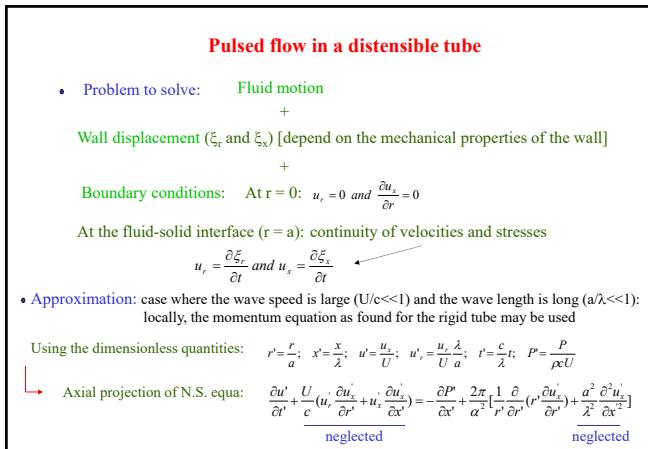

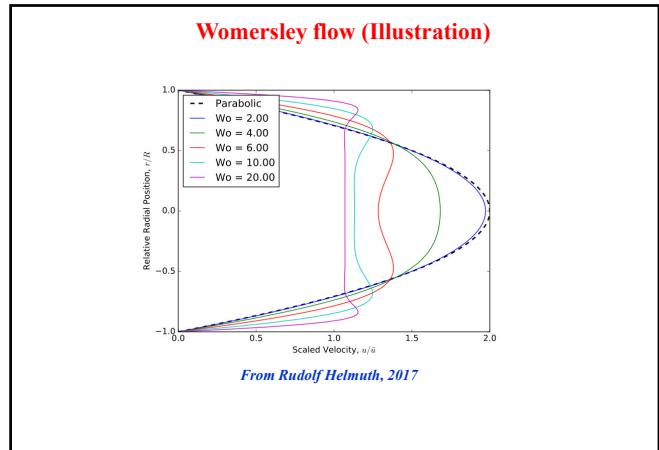

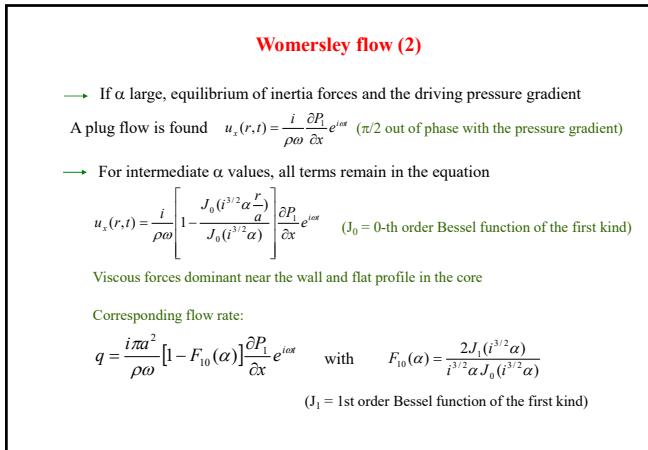

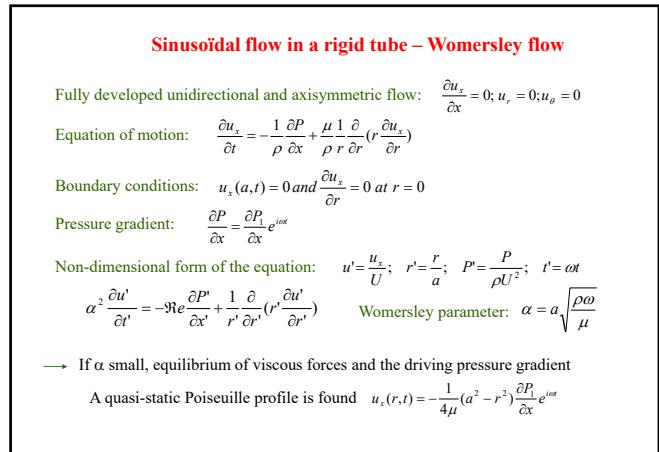

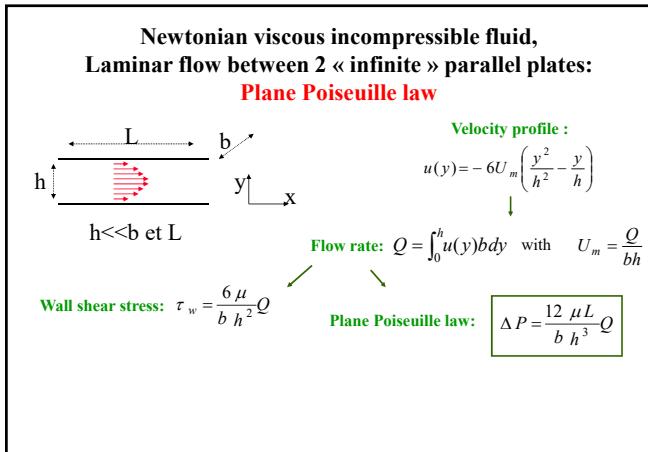

$$\text{Velocity profile: } u = -\frac{1}{4\mu} (a^2 - r^2) \frac{dP}{dx}$$

$$\text{Flow rate Q: } Q = \int_0^a u(r) 2\pi r dr$$

$$\text{Poiseuille law: } \Delta P = \frac{8\mu L}{\pi a^4} Q$$

$$\text{Max velocity: } U_{\max} = 2 U_{\text{moy}}$$

$$\text{Wall shear stress: } \tau_w = \frac{4\mu}{\pi a^3} Q$$

Bernoulli's equation: pressure drops

- Ecoulement laminaire dans une **conduite cylindrique** de rayon a et longueur l :

$$\zeta = \frac{64}{Re} \frac{l}{2a}$$

où Re est le nombre de Reynolds, donné par : $Re = \frac{\rho V 2a}{\mu}$

Ex1: vérifier que le nombre de Reynolds est un nombre sans dimension.

Ex2: montrer que, dans ce cas, on obtient la relation: $\Delta P_f = \frac{8\mu l}{\pi a^4} Q$

- Rétrécissement brusque de la canalisation:

$$\zeta = \frac{1}{2} \left(1 - \frac{D_2^2}{D_1^2} \right) \quad \Delta P_f = \zeta \frac{1}{2} \rho V_2^2$$

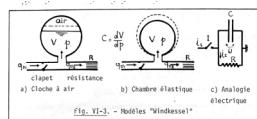

- Elargissement brusque de la canalisation:

$$\zeta = \left(1 - \frac{D_2^2}{D_1^2} \right)^2 \quad \Delta P_f = \zeta \frac{1}{2} \rho V_1^2$$

LUMPED PARAMETER MODELS

Windkessel model – O. Franck (1899)

Cardiac valve + elastic chamber (arterial compliance C) + peripheral resistance R

(From Comolet, 1984, Masson)

Electric analogy

- Pressure drop ΔP / voltage U

- Flow rate Q / current I

- Resistance: $U = R I$

- Compliance: $U = \frac{1}{C} \int I dt$

- Cardiac valve closed (diastole): Blood stored in the chamber flows through the resistance

$$\frac{dV}{dt} + q_{v2} = 0; \quad q_{v1} = 0; \quad P = Rq_{v2}$$

→ Differential equation: $C \frac{dP}{dt} + \frac{P}{R} = 0$

→ Solution: $P = P_0 e^{-\frac{t-t_0}{RC}}$

P_0 = pressure at the beginning of diastole ($t = t_0$); P_1 = pressure at the end of diastole ($t = t_1$)

$$\rightarrow P_1 = P_0 e^{-\frac{t_1-t_0}{RC}}$$

2-element Windkessel model (2)

- Cardiac valve open (systole):

$$q_{v1} = \frac{dV}{dt} + q_{v2}; \quad P = Rq_{v2}$$

- Differential equation:

$$RC \frac{dP}{dt} + P = Rq_{v2} = RA$$

- Solution:

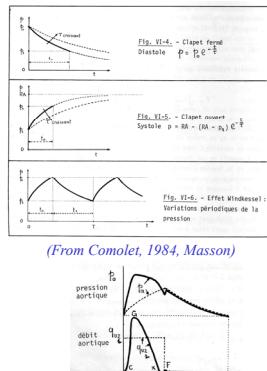

$$P = RA + (P_1 - RA)e^{-\frac{t-t_0}{RC}}$$

P_0 = pressure at the beginning of systole
 P_1 = pressure at the end of systole ($t = t_0$)

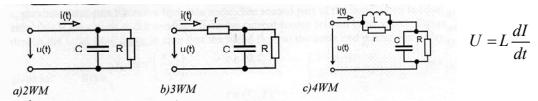

$$P_0 = RA + (P_1 - RA)e^{-\frac{t_0-t_0}{RC}}$$

→ P varies between P_0 and P_1 :

$$P_0 = RA \frac{[1 - e^{-(t_0-t)/RC}]}{[1 - e^{-(T-t)/RC}]} \text{ and } P_1 = RA \frac{[1 - e^{(t_0-t)/RC}]}{[1 - e^{(T-t)/RC}]}$$

Extension of Windkessel models

3 elt-WM: R of aorta is added; 4 elt-WM: an inductor is added, representing inertia of blood

Differential equations:

$$3 \text{ elt-WM: } (R+r)i(t) + RrC \frac{di(t)}{dt} = u(t) + RC \frac{du(t)}{dt}$$

$$4 \text{ elt-WM: } CLR \frac{d^2i(t)}{dt^2} + L(r+R) \frac{di(t)}{dt} + rRi(t) = CLR \frac{d^2u(t)}{dt^2} + (L+CrR) \frac{du(t)}{dt} + ru(t)$$

(Olufsen and Nadim, *Math. Biosciences and Engineering*, 2004)

Lumped parameter models:

- No spatial dependency; time variable only
- Consider elementary components of the circulatory tree as « compartments »
- Flow rate and pressure are averaged in space over the whole compartment
- Wave propagation and reflection cannot be incorporated

Parameter determination

The R , L , C parameters depend on the blood and vessel wall mechanical properties

→ For a vessel of length l , radius a , wall thickness h , wall Young modulus E :

- Pietrabissa et al. (*Med. Engin. Physics*, 1996) $R = \frac{8\mu l}{\pi a^4}, \quad L = \frac{\rho l}{\pi a^2}, \quad C = \frac{2\pi a^3 l}{Eh}$

- Quarterni et al. (*Computing and Visualization in Science*, 2001) $C = \frac{9\pi a^3 l}{8Eh}$
(σ = Poisson ratio = $\frac{1}{2}$, if vessel wall considered as incompressible)

<http://mox.polimi.it/it/progetti/pubblicazioni>

- Comolet (*Biomécanique circulatoire*, 1984) $C = \frac{3}{2} \frac{\pi a^3 l}{Eh} \left(\frac{1+h}{1+h} \right)^2$

Introduction to 1D models

- 1D non linear systems which model the blood pulse propagation in compliant arteries
- Obtained by averaging the N. Stokes equ. on each section of an arterial vessel and using simplified models for the vessel compliance

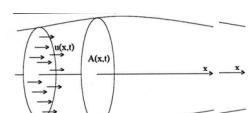

Simplifying assumptions

- The dominant component of blood flow velocity is oriented along the vessel axis and pressure can be assumed constant (or averaged) over the cross-section of the vessel

- Fixed cylinder axis and axial symmetry

- Radial wall displacements ($a(x)$)

$$q = 2\pi \int_0^a u_x(r, x, t) r dr \quad \frac{\partial A}{\partial t} = 2\pi a \frac{\partial a}{\partial t}$$

1D models equations

→ 2 ways of deriving 1D models equations

- Integration of the axial projection of N. Stokes equ, with asymptotic analysis by assuming that a_0/l is small (*Olufsen et al., Annals of Biomedical Engineering, 2000*)

- Basic conservation laws written in integral form (*Formaggia, Veneziani, and coll.*)

→ Coupled system of differential equations (unknowns = A, q, P)

- Continuity equation $\frac{\partial q}{\partial x} + \frac{\partial A}{\partial t} = 0$

- Momentum equation → Olufsen's formulation $\frac{\partial q}{\partial t} + \frac{\partial}{\partial x}(2\pi \int_0^r u_s^2 r dr) + \frac{A}{\rho} \frac{\partial P}{\partial x} = 2\pi \frac{\mu}{\rho} [r \frac{\partial u_s}{\partial r}]_s$

↓
Mox team formulation $\frac{\partial q}{\partial t} + \alpha \frac{\partial}{\partial x}(\frac{q^2}{A}) + \frac{A}{\rho} \frac{\partial P}{\partial x} + K_r \frac{q}{A} = 0$

with $\begin{cases} u_s(r, x, t) = \bar{u}(x, t) s(y) \\ y = \frac{r}{a(x, t)} \end{cases}$ and $\begin{cases} \alpha = \frac{1}{A \bar{u}^2} \int_A u_s^2 dA \\ K_r = -2\pi \frac{\mu}{\rho} [s'(y)]_{y=1} \end{cases}$
 s = velocity profile law
 α = momentum correction coeff
 K_r = resistance parameter

1D models equations (2)

→ Choice of a velocity profile

Olufsen's formulation

$$u_s = \begin{cases} \bar{u}_s \text{ for } r \leq a - \delta \\ \bar{u}_s \frac{(a-r)}{\delta} \text{ for } a - \delta < r < a \\ 0 \text{ for } r \geq a \end{cases}$$

(Flat velocity profile except in a thin boundary layer of width $\delta \ll a$)

● State equation

Olufsen's formulation

$$P(x, t) - P_0 = \frac{4}{3} \frac{Eh}{a_0(x)} \left[1 - \sqrt{\frac{A_0(x)}{A(x, t)}} \right]$$

$a_0(x)$: shape of the vessel
 when transmural pressure is zero

Mox team formulation

$$s(y) = \frac{(\gamma+2)}{\gamma} (1 - y^\gamma)$$

- When $\gamma = 2$, Poiseuille profile

- The higher γ , the flatter the profile

Mox team formulation

$$P(x, t) - P_0 = \beta (\sqrt{A} - \sqrt{A_0}) \text{ with } \beta = \frac{\sqrt{\pi} Eh}{(1 - \sigma^2) A_0}$$

(σ = Poisson coefficient)

Equivalence of the 2 formulations

Olufsen's formulation

$$\begin{aligned} q &= A \bar{u}_s (1 - \frac{\delta}{a} + O(\delta^2)) \\ 2\pi \frac{\mu}{\rho} [r \frac{\partial u_s}{\partial r}]_{r=a} &= -2\pi \frac{\mu}{\rho} \frac{a}{\delta} (\frac{q}{A}) (1 + O(\delta)) \\ 2\pi \int_0^r u_s^2 r dr &= \frac{q^2}{A} (1 + \frac{2}{3} \frac{\delta}{a} + O(\delta^2)) \end{aligned}$$

Momentum equation

Mox team formulation

$$\begin{aligned} K_r &= 2\pi \frac{\mu}{\rho} (\gamma + 2) \\ \alpha &= \frac{\gamma + 2}{\gamma + 1} \\ \text{Momentum equation} & \quad \downarrow \\ \frac{\partial q}{\partial t} + \frac{\partial}{\partial x}(\frac{q^2}{A}) + \frac{A}{\rho} \frac{\partial P}{\partial x} + 2\pi \frac{\mu}{\rho} (\gamma + 2) (\frac{q}{A}) &= 0 \end{aligned}$$

Suggested value of γ : $\gamma = 9$

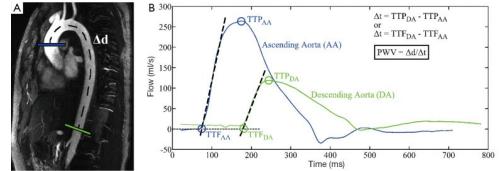

Suggested value of a/δ :
 about 10, for large arteries

Exemple de mesure non invasive

Le module d'Young de la paroi aortique

→ Mesure de la célérité de l'onde de pouls (déf. radiale) par IRM

Temps nécessaire à l'onde pour aller d'une section de l'artère à une autre: PWV = $\Delta t / \Delta x$

Wentland et al. (2014) Cardio Vasc Diagn Ther

→ Formule de Moens-Korteweg

$$PWV = \sqrt{\frac{Eh}{2\rho R}}$$

E = module Young paroi artère (Pa)
 (hyp: isotrope, mince, élastique)
 h, R = épaisseur et rayon du vaisseau (m)
 ρ = masse volumique du sang (kg/m³)

Le module d'Young de la paroi aortique (suite)

→ Ordre de grandeur (non pathologique): $R = 1 \text{ cm}$, $h = 2 \text{ mm}$, $\rho = 1050 \text{ kg/m}^3$, PWV environ 9 m/s, E environ 10^6 Pa .

→ Alterations par vieillissement, maladies inflammatoires, athérosclérose, diabète, calcification, ... : risque cardio-vasculaire

→ Avantage de la méthode: tient compte de l'influence des tissus environnants (muscles, graisse, os, ...) sur la paroi artérielle

→ Si champ B très élevé, B peut avoir une influence sur PWV

A. Drochon (2016) « Sinusoidal flow of blood in a cylindrical deformable vessel exposed to an external magnetic field » Eur. Phys. J. App. Phys. 73:31101

Starling law

→ Represents the fluid flow across the endothelial cells layer

$$J = AL_p [(P_c - P_i) - \sigma(\pi_p - \pi_i)]$$

L_p = hydraulic conductivity of the endothelium (m/Pa.s)

A = area of the capillary wall available for filtration (m²)

P_c = capillary hydrostatic pressure (Pa)

P_i = interstitial fluid (tissue) hydrostatic pressure (Pa)

σ = reflection coefficient (no unit)

Π_p = plasma protein oncotic pressure (Pa)

Π_i = interstitial fluid oncotic pressure (Pa)

● Albumin is responsible for about 70% of the oncotic pressure

Plasma protein conc. (g/l)	40	60	80
Oncotic pressure (mmHg)	10	20	30

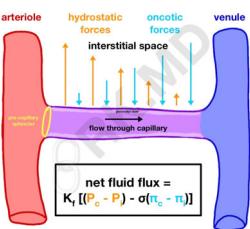

● The reflection coefficient σ for protein permeability is specific for each membrane and protein

σ = 0 : membrane is maximally permeable to the protein;

σ = 1: membrane is totally impermeable

Starling law (2)

STARLING EQUATION

<https://rk.md/2018/starling-forces-hydrostatic-and-oncotic-pressure/>

- In the **postarteriolar capillary segments**, the hydrostatic pressure is greater than the oncotic pressure, favouring the movement of water into the interstitial fluid; in the **postcapillary venules**, oncotic pressure greater than hydrostatic pressure, favouring the movement of water out of the interstitial fluid to the venules
- Oncotic pressure** = colloido-osmotic pressure = osmotic pressure that draws water towards the proteins

Fick's diffusion law

- Fick's first law: diffusive flux**: the movement of particles from high to low concentrations is proportional to the particle's concentration gradient

$$\vec{J} = -D \vec{\text{grad}} \phi \quad J \text{ is the diffusion flux vector (amount of substance / m}^2.\text{s)}$$

D is the diffusion coefficient (m^2/s)

$\text{grad } \phi$ is the concentration gradient (amount of substance / $\text{m}^3.\text{m}$)

- Fick's second law**: predicts how diffusion causes the concentration to change with respect to time

$$\frac{\partial \phi}{\partial t} = \text{div} (D \vec{\text{grad}} \phi) \quad \text{If } D \text{ does not depend on space coordinates:}$$

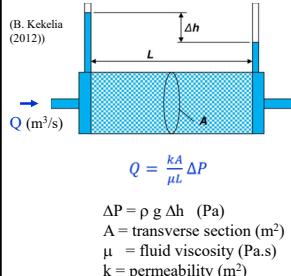

$$\frac{\partial \phi}{\partial t} = D \Delta \phi$$

- Diffusion coefficient for a molecule suspended in a viscous medium:** (Stokes-Einstein equation)

$$D = \frac{k_B T}{6\pi\mu a}$$

k_B is Boltzmann constant ($= 1.38 \cdot 10^{-23} \text{ m}^2.\text{kg} / \text{s}^2.\text{K}$)
T is the absolute temperature (K)
 μ = dynamic viscosity of the medium (Pa.s)
a = equivalent radius of the molecule (m)

Darcy's law: porous medium

- Medium porosity: Φ**

$$\Phi = \frac{\text{volume of void space}}{\text{total volume}}$$
- Flow velocity: u (m/s)**

$$u = \frac{Q}{\Phi A}$$
- Flow rate: Q (m³/s)**

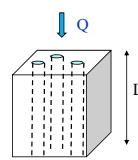

$$q = \frac{Q}{A}$$
 is not the velocity at which the fluid is travelling through the pores
- Hydraulic conductivity: K (m/s)**
(Flow of water)

$$K = k \frac{\rho g}{\mu}$$

- A medium may be extremely porous, but if the pores are not connected, it will have no permeability. The voids can have different shapes and connectivity, which affects how easily a fluid can move through the pore space. The permeability is a measure of the ease with which liquids and gases can pass through a medium

Darcy's law: example

A parallel bundle of n vertical tubes

Poiseuille law in each pore:

$$\Delta P = \frac{8\mu L}{\pi a^4} \frac{Q}{n}$$

$$Q = \frac{n \Delta P \pi a^4}{8\mu L} = \frac{A \Phi \Delta P a^2}{8\mu L}$$

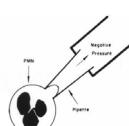

$$Q = \frac{\Phi a^2 A \Delta P}{8 \mu L} = \frac{k A \Delta P}{\mu L}$$

→ Relation between **porosity** and **permeability**

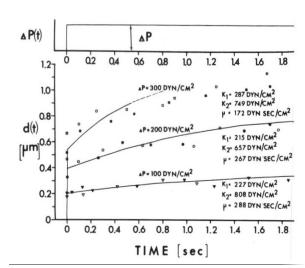

$$k = \frac{\Phi a^2}{8}$$

$$\Phi = \text{porosity} = \frac{n \pi a^2 L}{A L} = \frac{n \pi a^2}{A}$$

Visco-elasticity: example with leucocyte micropipette aspiration

From White Cell Mechanics, A.R. Liss Ed., 1984

Visco-elasticity: basic tools

Elastic solid:

$$\begin{array}{l} \text{---} \\ \text{---} \end{array} \quad T = Kd$$

Viscous dashpot:

$$\begin{array}{l} \text{---} \\ \text{---} \end{array} \quad T = \mu \dot{d}$$

Maxwell element:

$$T = \mu \dot{d}_1 = K d_2$$

$$d = d_1 + d_2$$

$$\frac{\dot{T}}{K} + \frac{T}{\mu} = \dot{d}$$

$$T = K d_0 \exp(-\frac{K}{\mu} t)$$

Visco-elasticity: basic tools (2)

Voigt element:

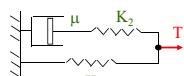

$$T = \mu \dot{d}_1 + K d_2$$

$$d = d_1 = d_2$$

Creep function :
d(t), for fixed T (=T₀)

$$d = \frac{T_0}{K} [1 - \exp(-\frac{K}{\mu} t)]$$

Kelvin element :

$$T = T_1 + T_2$$

$$T_1 = K_1 d$$

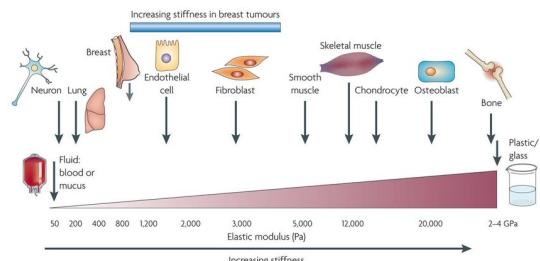

$$\dot{d} = \frac{T_2}{\mu} + \frac{\dot{T}_2}{K_2}$$

Stress-strain constitutive equation obtained from:

$$T + \frac{\mu}{K_2} \dot{T} = K_1 d + \mu (1 + \frac{K_1}{K_2}) \dot{d}$$

Introduction to solid and soft tissues mechanics

Orders of magnitude

Strain tensor

Réponse à une contrainte:

pour solide: pour fluide:
une déformation une vitesse de déformation

M, à t M', à t+dt Un point M du solide va être déplacé en M'; un point voisin N va être déplacé en N'

MM' est le vecteur déplacement en M; si il y a déformation du solide, le vecteur déplacement en M n'est pas le même que le vecteur déplacement en N. Le vecteur déplacement n'est pas le même aux différents endroits du solide : il dépend des coordonnées d'espace (x, y, z) (notées aussi (x₁, x₂, x₃)).

• Si on note:

$\frac{\zeta_1}{MM'} \zeta_2 \zeta_3$ le tenseur des déformations (en petites déformations)
 ζ_i est alors défini par:

$$[\zeta_i] = \frac{1}{2} \left(\frac{\partial \zeta_i}{\partial x_j} + \frac{\partial \zeta_j}{\partial x_i} \right)$$

Linear isotropic elastic solid: constitutive equation

Écriture développée du tenseur des déformations:

$$[\zeta_i] = \begin{bmatrix} \frac{\partial \zeta_1}{\partial x_1} & \frac{1}{2} \left(\frac{\partial \zeta_1}{\partial x_2} + \frac{\partial \zeta_2}{\partial x_1} \right) & \frac{1}{2} \left(\frac{\partial \zeta_1}{\partial x_3} + \frac{\partial \zeta_3}{\partial x_1} \right) \\ \frac{1}{2} \left(\frac{\partial \zeta_1}{\partial x_2} + \frac{\partial \zeta_2}{\partial x_1} \right) & \frac{\partial \zeta_2}{\partial x_2} & \frac{1}{2} \left(\frac{\partial \zeta_2}{\partial x_3} + \frac{\partial \zeta_3}{\partial x_2} \right) \\ \frac{1}{2} \left(\frac{\partial \zeta_1}{\partial x_3} + \frac{\partial \zeta_3}{\partial x_1} \right) & \frac{1}{2} \left(\frac{\partial \zeta_2}{\partial x_3} + \frac{\partial \zeta_3}{\partial x_2} \right) & \frac{\partial \zeta_3}{\partial x_3} \end{bmatrix}$$

→ Trace du tenseur des déformations (notée θ):

$$\theta = \frac{\partial \zeta_1}{\partial x_1} + \frac{\partial \zeta_2}{\partial x_2} + \frac{\partial \zeta_3}{\partial x_3}$$

définit la dilatation volumique relative d'un parallélépipède de volume initial V_0 : $\theta = (1 + \theta) V_0$

→ Loi de comportement du solide élastique linéaire:

$$\sigma_{ij} = \lambda \theta \delta_{ij} + 2 G e_{ij}$$

λ et G sont des constantes caractéristiques du milieu considéré, dites constantes de Lamé (homogène à des contraintes (Pa))

ou bien : $e_{ij} = -\frac{v}{E} (\sigma_{11} + \sigma_{22} + \sigma_{33}) \delta_{ij} + \frac{(1+v)}{E} \sigma_{ij}$

Mechanical parameters

E = module d'Young du matériau (en Pa)

v = coefficient de Poisson G est dit aussi: module de cisaillement

Relations entre ces grandeurs:

$$G = \frac{E}{2(1+\nu)} \quad \lambda = \frac{\nu E}{(1+\nu)(1-2\nu)} \quad \nu = -\frac{\lambda}{2(\lambda+G)} \quad E = \frac{G(3\lambda+2G)}{(\lambda+G)}$$

→ Interprétation physique simple du coeff. de Poisson:

Traction uni-axiale d'un cylindre de longueur initiale l₀ et rayon r₀; l et r sont la longueur et le rayon après traction

$$\text{Alors: } \frac{r - r_0}{r_0} = -\nu \left(\frac{l - l_0}{l_0} \right) = -\nu \varepsilon$$

v définit donc la variation de rayon qui résulte de la variation de longueur du cylindre

Le volume du cylindre est : $V = l \pi r^2$

$$\text{En écriture différentielle, ceci donne: } \frac{\Delta V}{V_0} = \frac{\Delta l}{l_0} + 2 \frac{\Delta r}{r_0} = (1-2\nu)\varepsilon$$

Ainsi, pour un matériau incompressible, on aura : $\Delta V = 0$ et $v = 0.5$

Elastic wave propagation in a continuous medium

→ Une onde engendre dans un milieu continu un déplacement transitoire MM' de faible amplitude et de faible vitesse, mais qui se propage avec une vitesse c élevée.

→ Une onde élastique qui se propage dans un milieu isotrope est en fait constituée de deux ondes qui se propagent à des vitesses différentes : c_L, pour l'onde longitudinale et c_t, pour l'onde transversale

Onde longitudinale (ou « de compression »)

$$\zeta_L \rightarrow c_L \rightarrow Ox$$

ζ_L = proj. longitudinale du vecteur MM'

$$\frac{\partial^2 \zeta_1}{\partial x^2} - \frac{\rho(1+\nu)(1-2\nu)}{E(1-\nu)} \frac{\partial^2 \zeta_1}{\partial t^2} = 0$$

$$= \frac{1}{c_L^2}$$

Onde transverse (ou « de cisaillement »)

$$\zeta_t \rightarrow c_t \rightarrow Ox$$

ζ_t = proj. transverse de MM'

$$\frac{\partial^2 \zeta_2}{\partial x^2} - \frac{2\rho(1+\nu)}{E} \frac{\partial^2 \zeta_2}{\partial t^2} = 0$$

$$\frac{\partial^2 \zeta_3}{\partial x^2} - \frac{2\rho(1+\nu)}{E} \frac{\partial^2 \zeta_3}{\partial t^2} = 0$$

Application pour la biomécanique des tissus mous (tumeurs, peau, foie, ligaments, cartilage, tendons, sein, graisse, ...)

- La célérité des ondes s'exprime en fonction des propriétés mécaniques du matériau:

$$c_t^2 = \frac{E(1-\nu)}{\rho(1+\nu)(1-2\nu)} \quad \text{et} \quad c_r^2 = \frac{E}{2\rho(1+\nu)}$$

Donc, si on mesure les célérités, on peut en déduire E et ν

- Principe de l'**élastographie ultra-sonore**
(propagation des ultra-sons dans le corps)
