Insuffisance cardiaque : définition

3.1 Definition of heart failure

Heart failure is not a single pathological diagnosis, but a clinical syndrome consisting of cardinal symptoms (e.g. breathlessness, ankle swelling, and fatigue) that may be accompanied by signs (e.g. elevated jugular venous pressure, pulmonary crackles, and peripheral oedema). It is due to a structural and/or functional abnormality of the heart that results in elevated intracardiac pressures and/or inadequate cardiac output at rest and/or during exercise.

Table 3 Definition of heart failure with reduced ejection fraction, mildly reduced ejection fraction and preserved ejection fraction

Type of HF		HFrEF	HFmrEF	HFpEF
CRITERIA	1	Symptoms ± Signs[a]	Symptoms ± Signs[a]	Symptoms ± Signs[a]
	2	LVEF ≤40%	LVEF 41–49%[b]	LVEF ≥50%
	3	–	–	Objective evidence of cardiac structural and/or functional abnormalities consistent with the presence of LV diastolic dysfunction/raised LV filling pressures, including raised natriuretic peptides[c]

© ESC 2021

Etiologies

Table 5 Causes of heart failure, common modes of presentation and specific investigations

Cause	Examples of presentations	Specific investigations
CAD	Myocardial infarction Angina or "angina-equivalent" Arrhythmias	Invasive coronary angiography CT coronary angiography Imaging stress tests (echo, nuclear, CMR)
Hypertension	Heart failure with preserved systolic function Malignant hypertension/acute pulmonary oedema	24 h ambulatory BP Plasma metanephrines, renal artery imaging Renin and aldosterone
Valve disease	Primary valve disease e.g., aortic stenosis Secondary valve disease, e.g. functional regurgitation Congenital valve disease	Echo – transoesophagealstress
Arrhythmias	Atrial tachyarrhythmias Ventricular arrhythmias	Ambulatory ECG recording Electrophysiology study, if indicated
CHPs	AS Dilated Hypertrophic Restrictive ARVC Peripartum	CMR, genetic testing Right and left heart catheterization
	Takotsubo syndrome Toxins: alcohol, cocaine, iron, copper	CMR, angiography Trace elements, toxicology, LFTs, GGT
Congenital heart disease	Congenitally corrected/repaired transposition of great arteries Shunt lesions Repaired tetrology of Fallot Ebstein's anomaly	CMR
Infiltrative	Viral myocarditis Chagas disease HIV Lyme disease	CMR, EMB Serology
Drug-induced	Anthracyclines Trastuzumab VEGF inhibitors Immune checkpoint inhibitors Proteasome inhibitors RAF+MEK inhibitors	
Infiltrative	Amyloid Sarcoidosis Neoplastic	Serum electrophoresis and serum free light chains, Bence Jones protein, bone scintigraphy, CMR, CT-PET, EMB Serum ACE, CMR, FDG-PET, chest CT, EMB CMR, EMB
Storage disorders	Haemochromatosis Fabry disease Glycogen storage diseases	Iron studies, genetics, CMR (T2* imaging), EMB α-galactosidase A, genetics, CMR (T1 mapping)
Endomyocardial disease	Radiotherapy Endomyocardial fibrosis/eosinophilia Carcinoid	CMR EMB 24 h urine 5-HIAA
Pericardial disease	Calcification Infiltrative	Chest CT, CMR, right and left heart catheterization
Metabolic	Endocrine disease Nutritional disease (thiamine, vitamin B1 and selenium deficiencies)	TFTs, plasma metanephrines, renin and aldosterone, cortisol Specific plasma nutrients
	Autoimmune disease	ANA, ANCA, rheumatology review
Neuromuscular disease	Friedreich's ataxia Muscular dystrophy	Nerve conduction studies, electromyogram, genetics CK, electromyogram, genetics

ESC GUIDELINES

2021 ESC Guidelines for the diagnosis and treatment of acute and chronic heart failure

Table 13 Criteria for definition of advanced heart failure

All the following criteria must be present despite optimal medical treatment:

1. Severe and persistent symptoms of heart failure [NYHA class III (advanced) or IV].
2. Severe cardiac dysfunction defined by at least one of the following:
   - LVEF ≤30%
   - Isolated RV failure (e.g., ARVC)
   - Non-operable severe valve abnormalities
   - Non-operable severe congenital abnormalities
   - Persistently high (or increasing) BNP or NT-proBNP values and severe LV diastolic dysfunction or structural abnormalities (according to the definitions of HFpEF).
3. Episodes of pulmonary or systemic congestion requiring high-dose i.v. diuretics (or diuretic combinations) or episodes of low output requiring inotropes or vasoactive drugs or malignant arrhythmias causing >1 unplanned visit or hospitalization in the last 12 months.
4. Severe impairment of exercise capacity with inability to exercise or low 6MWT distance (<300 m) or pVO_2 <12 mL/kg/min or <50% predicted value, estimated to be of cardiac origin.

The updated HFA-ESC 2018 criteria for the definition of advanced HF are reported in *Table 13*.[376] A severely reduced LVEF is common but not required for a diagnosis of advanced HF as it may develop in patients with HFpEF as well. In addition to the reported criteria, extra-cardiac organ dysfunction due to HF (e.g. cardiac cachexia, liver or kidney dysfunction) or type II pulmonary hypertension may be present, but are not required for the definition of advanced HF.[376]

Table 14 Interagency Registry for Mechanically Assisted Circulatory Support profile descriptions of patients with advanced heart failure

Profile	Time frame for intervention
Profile 1. Critical cardiogenic shock Patient with life-threatening hypotension despite rapidly escalating inotropic support, critical organ hypoperfusion, often confirmed by worsening acidosis and/or lactate levels. "Crash and burn."	Definitive intervention needed within hours.
Profile 2. Progressive decline Patient with declining function despite i.v. inotropic support, may be manifest by worsening renal function, nutritional depletion, inability to restore volume balance, "Sliding on inotropes." Also describes declining status in patients unable to tolerate inotropic therapy.	Definitive intervention needed within few days.
Profile 3. Stable on inotrope or inotrope-dependent Patient with stable blood pressure, organ function, nutrition, and symptoms on continuous i.v. inotropic support (or a temporary circulatory support device or both) but demonstrating repeated failure to wean from support due to recurrent symptomatic hypotension or renal dysfunction. "Dependent stability."	Definitive intervention elective over a period of weeks to few months.
Profile 4. Frequent Flyer Patient can be stabilized close to normal volume status but experiences daily symptoms of congestion at rest or during activities of daily living. Doses of diuretics generally fluctuate at very high levels. More intensive management and surveillance strategies should be considered, which may in some cases reveal poor compliance that would compromise outcomes with any therapy. Some patients may shuttle between 4 and 5.	Definitive intervention elective over a period of weeks to few months.
Profile 5. Housebound Comfortable at rest and with activities of daily living but unable to engage in any other activity, living predominantly within the house. Patients are comfortable at rest without congestive symptoms, but may have underlying refractory elevated volume status, often with renal dysfunction. If underlying nutritional status and organ function are marginal, patients may be more at risk than INTERMACS 4, and require definitive intervention.	Variable urgency, depends upon maintenance of nutrition, organ function, and activity.
Profile 6. Exertion limited Patient without evidence of fluid overload, comfortable at rest and with activities of daily living and minor activities outside the home but fatigues after the first few minutes of any meaningful activity. Attribution to cardiac limitation requires careful measurement of peak oxygen consumption, in some cases with haemodynamic monitoring, to confirm severity of cardiac impairment. "Walking-wounded."	Variable, depends upon maintenance of nutrition, organ function, and activity level.
Profile	**Time frame for intervention**
Profile 7. Advanced NYHA class III symptoms Patient without current or recent episodes of unstable fluid balance, living comfortably with meaningful activity limited to mild physical exertion.	Heart transplantation or MCS may not be currently indicated.

Scores pronostiques existants

Table 5 Prognostic scores

Score	Components	Comments
HFSS[122]	• Presence/absence coronary artery disease • Resting heart rate • Left ventricular ejection fraction • Mean arterial blood pressure • Presence/absence of intraventricular conduction delay • Serum sodium • Peak oxygen uptake HFSS = [(0.0216 * resting HR) + (−0.0255 * mean BP) + (−0.0464 * LVEF) + (−0.047 * serum sodium) + (−0.0546 * peak VO_2) + (0.608 * presence or absence of IVCD) + (0.6931 * presence or absence of ischaemic heart disease)]	Score is based on a sum of these variables multiplied by defined coefficients Low risk: ≥8.1 Medium-risk: HFSS 7.20 to 8.09 High-risk: HFSS ≤7.1
SHMP[139]	• Demographics • Clinical characteristics • Medications • Laboratory data • Devices www.seattleheartfailuremodel.org	Incorporates impact of interventions (medical and device) and provides estimates of 1, 2, and 3-year survival
MECKI[134–136]	• Percent predicted peak VO_2 • V_E/VCO_2 slope • Haemoglobin • Serum sodium • LVEF • eGFR by MDRD	Incorporates data from the CPET as well as kidney function
MAGGIC[155]	• Age • Gender • LVEF • Systolic blood pressure • Body mass index • Serum creatinine • NYHA class • Smoking history • Co-morbidities (e.g. diabetes, COPD) • Length of heart failure diagnosis • Medications www.heartfailurerisk.org	Risk model converted into integer score Generalizable to a broad spectrum of patients

The 2016 International Society for Heart Lung Transplantation listing criteria for heart transplantation: A 10-year update

1.2. Use of heart failure prognosis scores

Heart failure prognosis scores should be performed along with cardiopulmonary exercise test to determine prognosis and guide listing for transplantation for ambulatory patients. An estimated 1-year survival as calculated by the Seattle Heart Failure Model (SHFM) of < 80% or a Heart Failure Survival Score (HFSS) in the high/medium risk range should be considered as reasonable cut points for listing. (Class IIb, Level of Evidence: C).

Listing patients solely on the criteria of heart failure survival prognostic scores should not be performed (Class III, Level of Evidence: C).

- Scores dérivés de cohortes mono centriques anciennes sur pts sélectionnés

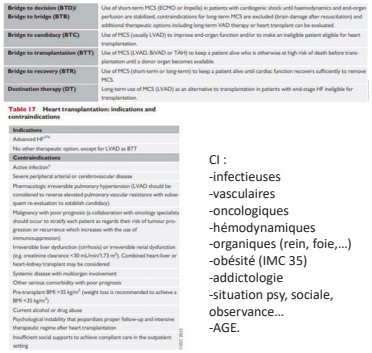
- Ultrafiltration ou dialyse péritonéale palliative ?
- Prise en charge multidisciplinaire palliative ?

Options chirurgicales

- LVAD
- Transplantation



Bridge to decision (BTD)/ Bridge to bridge (BTB)	Use of short-term MCS (ECMO or Impella) in patients with cardiogenic shock until haemodynamics and end-organ perfusion are stabilized, contraindications for long-term MCS are excluded (brain damage after resuscitation) and additional therapeutic options including long-term VAD therapy or heart transplant can be evaluated.
Bridge to candidacy (BTC)	Use of MCS (usually LVAD) to improve end-organ function and/or to make an ineligible patient eligible for heart transplantation.
Bridge to transplantation (BTT)	Use of MCS (LVAD, BiVAD or TAH) to keep a patient alive who is otherwise at high risk of death before transplantation until a donor organ becomes available.
Bridge to recovery (BTR)	Use of MCS (short-term or long-term) to keep a patient alive until cardiac function recovers sufficiently to remove MCS.
Destination therapy (DT)	Long-term use of MCS (LVAD) as an alternative to transplantation in patients with end-stage HF ineligible for transplantation.

Table 17 Heart transplantation: indications and contraindications

Indications
Advanced HF[196]
No other therapeutic option, except for LVAD as BTT
Contraindications
Active infection*
Severe peripheral arterial or cerebrovascular disease
Pharmacologic irreversible pulmonary hypertension (LVAD should be considered to reverse elevated pulmonary vascular resistance with subsequent re-evaluation to establish candidacy)
Malignancy with poor prognosis (a collaboration with oncology specialists should occur to stratify each patient as regards their risk of tumour progression or recurrence which increases with the use of immunosuppression)
Irreversible liver dysfunction (cirrhosis) or irreversible renal dysfunction (e.g. creatinine clearance <30 mL/min/1.73 m²). Combined heart-liver or heart-kidney transplant may be considered
Systemic disease with multiorgan involvement
Other serious comorbidity with poor prognosis
Pre-transplant BMI >35 kg/m² (weight loss is recommended to achieve a BMI <35 kg/m²)
Current alcohol or drug abuse
Psychological instability that jeopardizes proper follow-up and intensive therapeutic regime after heart transplantation
Insufficient social supports to achieve compliant care in the outpatient setting

Recommendations for the treatment of patients with advanced heart failure

Recommendations	Class*	Level*
Patients being considered for long-term MCS must have good compliance, appropriate capacity for device handling and psychosocial support.[ESC – 41a]	I	C
Heart transplantation is recommended for patients with advanced HF, refractory to medical/device therapy and who do not have absolute contraindications.	I	C
Long-term MCS should be considered in patients with advanced HFrEF despite optimal medical and device therapy, not eligible for heart transplantation or other surgical options, and without severe right ventricular dysfunction, to reduce the risk of death and improve symptoms.[178,795,797,801,802,804,817]	IIa	A
Long-term MCS should be considered in patients with advanced HFrEF refractory to optimal medical and device therapy as a bridge to cardiac transplantation in order to improve symptoms, reduce the risk of HF hospitalization and the risk of premature death.[795 – 800,802,804]	IIa	B
Renal replacement therapy should be considered in patients with refractory volume overload and end-stage kidney failure.	IIa	C
Continuous inotropes and/or vasopressors may be considered in patients with low cardiac output and evidence of organ hypoperfusion as bridge to MCS or heart transplantation.[805,806]	IIb	C
Ultrafiltration may be considered in refractory volume overload unresponsive to diuretic treatment.[811,812]	IIb	C

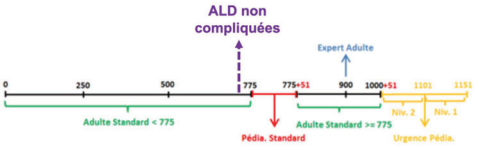
➡ Calcul de la durée de trajet entre le prélèvement et la transplantation.

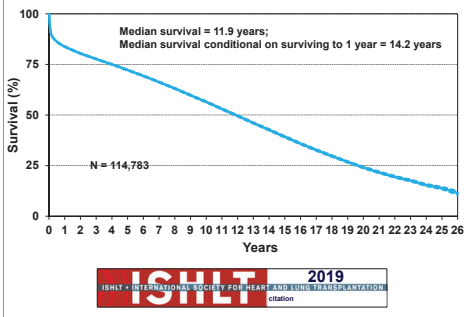
➡ SNAGC « final » ➡ Appel de l'ABM par ordre de SNAGC

Solution proposée pour les assistances de longue durée non compliquées

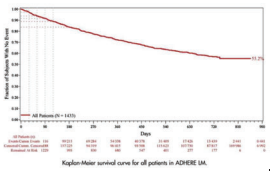
Pour les patients sous LVAD non compliqué, tous les X greffons proposés à un candidat avec moins de 750 points, octroi de 750 points au score hors appariement donneur (classement en fonction de la durée d'implantation)



Adult and Pediatric Heart Transplants
Kaplan-Meier Survival
(Transplants: January 1992 – June 2017)



ISHLT 2019 ISHLT • INTERNATIONAL SOCIETY FOR HEART AND LUNG TRANSPLANTATION Citation



Kaplan-Meier survival curve for all patients in ADHERE UM.

Conclusion

- ICA = pronostic sombre.
- Options thérapeutiques limitées, lourdes et projets complexes.
- Problématique de la pénurie de greffons, de la sélection des patients.
- Caractère perfectible du score cœur (CM restrictives, LVAD non compliqués…).
